The paper [1] gives qualitative spatial reasoning in Euclidean plane based solely on lines. The relations of parallelism and convergence between lines are considered.

In this talk we consider a continuation of [1] by adding a new predicate - perpendicularity. We introduce a first-order theory of lines in Euclidean plane with predicates parallelism, convergence and perpendicularity. The logic is complete with respect to the Euclidean plane, ω - categorical and not categorical in every uncountable cardinality. We prove that the membership problem of the logic is PSPACE-complete.
