An ideal $I$ on $\kappa$ is $\kappa^+$-saturated if every antichain of $(P(\kappa)/I, \leq_I)$ has cardinality $\leq \kappa$, and is $\kappa^+$-presaturated if $I$ is precipitous and the forcing $(P(\kappa)/I, \leq_I)$ preserves $\kappa$.

We answer an open question of [1] of whether there is a forcing extension that destroys $\kappa^+$-saturation of ideals on $\kappa$ while preserving their $\kappa^+$-presaturation in the affirmative.
